Question 1: What types of problems do traditional machine learning algorithms typically solve?

Question 2: For what problem is the loss function GIoU loss typically used for?

Question 3: What are some loss functions that are typically used for unsupervised learning?

Answer 1: Traditional machine learning algorithms typically solve either classification, regression, or unsupervised learning problems.

Answer 2: The loss functions GIoU loss is typically used for object detection in deep learning.

Answer 3: Some loss functions that are typically used for unsupervised learning are Square error, Distance error, Reconstruction error, and Negative variance.
